Himvia

A B2B fresh-produce network, starting with apples

Swastik Sainseth
Founder

Himachal Pradesh, India
October 2026

An operating base in Himachal

Himvia builds on our existing apple operation.

60,000-100,000

boxes handled in a typical apple season

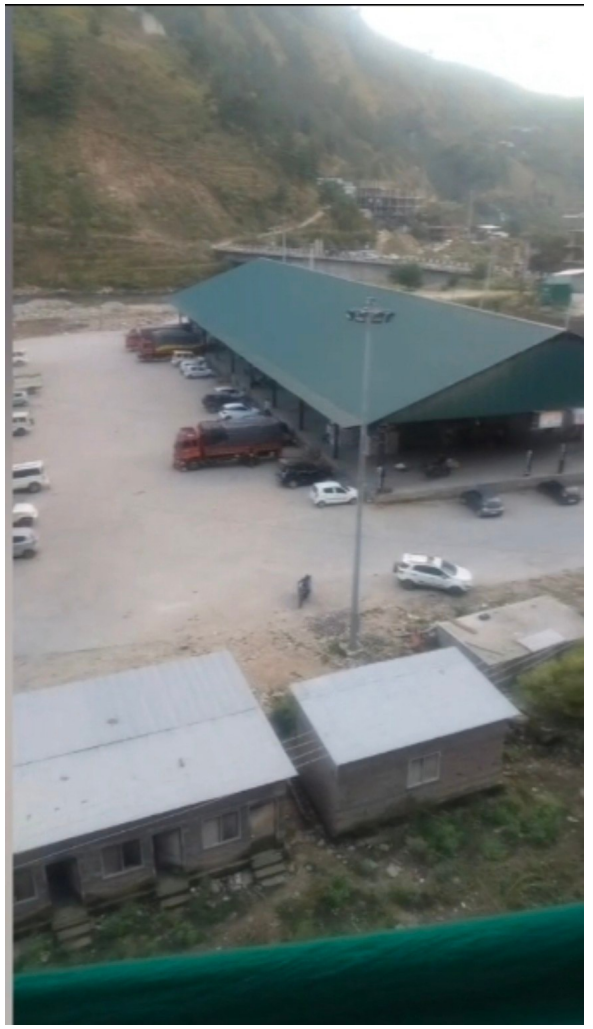

100+

farmer relationships

10-15

regular paying buyers

July to October season, with the busiest activity in August and September.

Local fruit market near our operation

Approximate figures for the existing operation. Volume varies with crop and weather.

The problems I see in the trade

A farmer customer with packed apples

Farmers wait for payment

Settlement often depends on when the buyer pays. Delays and defaults travel back through the chain.

Buyers need consistent supply

They need the right grade, quantity and packing, often across several suppliers.

Orders and credit are hard to track

Calls, WhatsApp and physical records carry much of the work. Quality, dispatch and payment records need to stay connected.

What I have built and run

I ran much of the grading and packing work during the 2024 and 2025 apple seasons.

A facility next to the market

I pushed for a location about 20 feet from the fruit market, close to farmers, brokers and buyers.

The work behind each order

I managed seasonal workers and coordinated harvesting, pickup, grading, packing and custom cartons.

I later hired a manager so repeatable work could run without me supervising every shift.

Peak facility capacity: over 1,000 boxes a day.

Grading equipment in the existing operation

How Himvia will fulfil an order

1. Agree the buyer's requirements

Grade, quantity, carton design, delivery date and payment terms.

2. Source through the network

Work with farmers and local broker partners, including direct procurement where it makes sense.

3. Grade, pack and arrange delivery

Prepare produce to the buyer's specifications, including cartons carrying the buyer's brand.

4. Track delivery and settlement

Record quality, dispatch and payments, with agreed farmer settlement dates and buyer credit limits.

Apple boxes packed in the existing operation

How the business earns money

Activity	Income	Stage
Brokerage and sourcing	Commission on completed sales	Existing operation
Grading, packing and labour	Service fees	Existing operation
Carton sales	Revenue from packaging sales	Existing operation
Direct procurement and supply	Trading and fulfilment margin	Planned for Himvia

INR 30-40 lakh total seasonal revenue

INR 15-20 lakh profit after expenses, during the July-October season.
Total revenue includes brokerage, services and carton sales.

Approximate, unaudited seasonal estimates from physical records. In brokerage, money passed to farmers is transaction value, not our commission revenue.

Expansion across fresh produce

Deepen the apple business

Build more repeat buyers, expand direct supply, and use the existing farmer and broker relationships.

Expand across fresh produce

Add crops and sourcing regions, with grading and packing near farms and a common buyer network.

Build national and export distribution

Develop operating hubs, cold storage and refrigerated transport as demand grows. Supply major produce categories throughout the year.

What funding would enable

I want to work full time on turning this operating base into a larger produce company.

Buyer acquisition and direct supply

Win repeat orders from retailers, wholesalers and exporters. Test fulfilment and payment terms on paid orders.

The first software and a small team

Build tools for lots, inventory, orders and payments. Hire engineering and sales help as the business grows.

Sole founder. Himvia is pre-incorporation, with no outside investment.
The existing operation supplies the experience, relationships and physical base.
